

ABSTRACT

Devices, softwares methods hand off a live call from an original leg of a first
5 modality (such as Circuit Switched Voice) to an alternate leg of another modality
(such as Voice over Internet Protocol). An original leg of a call is established using
the first modality. Then the alternate leg of the call is established using the second
modality, while the first leg is still established. Then the call is handed off from the
original leg to the alternate leg, while the connection is active.
